How ULF wave transport coupled to dynamic outer BC can explain the apparently diverse belt response

Radiation Belt Dynamics

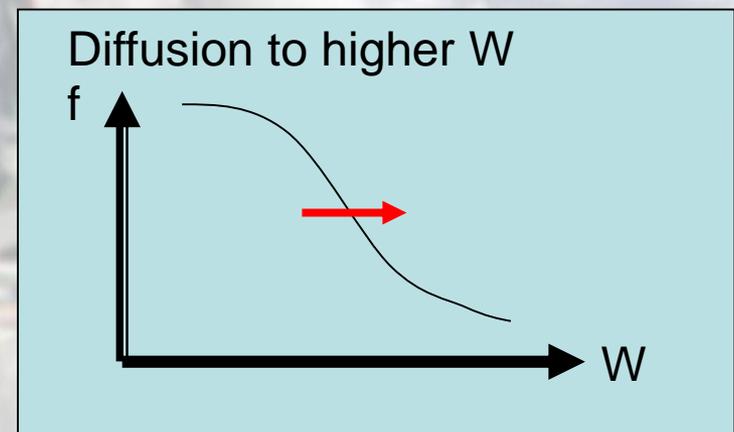

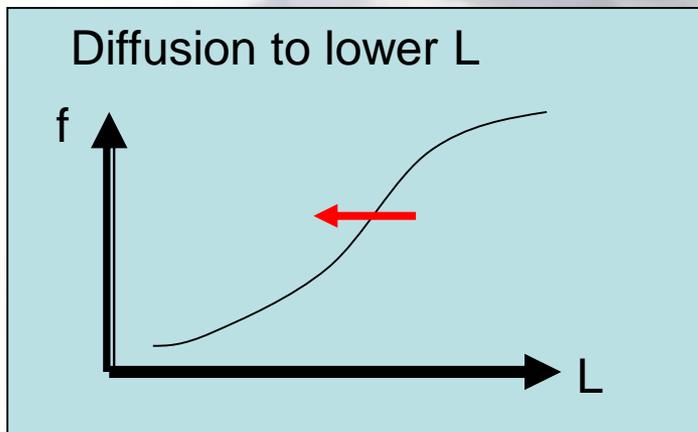

*Which wave-particle interactions?
Impact of (outer) boundary
condition dynamics?*

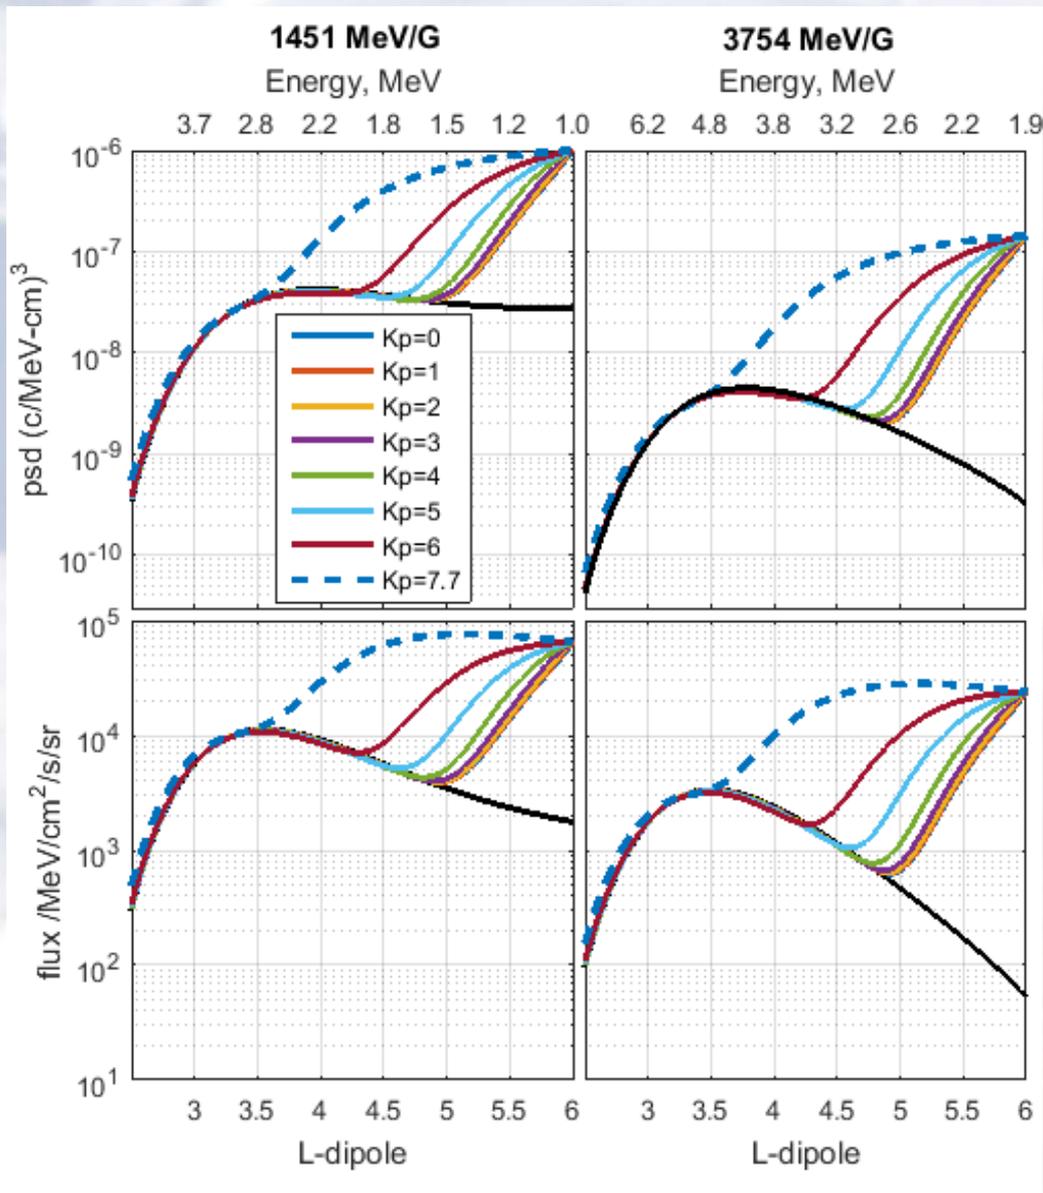

ULF Wave-MeV Electron Diffusion

- Rate of energy change due to ULF interactions:

$$\frac{dW}{dt} = q\mathbf{E} \cdot \mathbf{V}_d + \frac{M}{\gamma} \frac{\partial b}{\partial t}$$

- Can transport particles along phase space density gradients: inwards (energisation) or outwards (e.g., magnetopause loss; Loto'aniu et al., 2010; Turner et al., 2012; Mann et al., 2016) explain observed response?

How Quickly can Outer Boundary Impact the Radiation Belt?

Two hours of Ozeke et al. (2014) Kp dependent ULF wave radial transport (defined by ground ULF waves).

Mann and Ozeke, JGR, 2016.

ULF Wave Radial Diffusive Transport Model (Brizard & Chan, Phys. Plasmas, 2004)

$$\frac{df}{dt} = L^2 \frac{\partial}{\partial L} \left(\frac{1}{L^2} D_{LL} \frac{\partial f}{\partial L} \right) - \frac{f}{\tau}$$

Loss term

“MAGNETIC”

“ELECTRIC”

$$D_{LL}^m = \frac{1}{8} \left(\frac{M}{q\gamma B_0 R_E^2} \right)^2 \cdot L^4 \cdot \sum_m m^2 P_m^B(L, m\omega_D)$$

Compressional
Magnetic Field Power

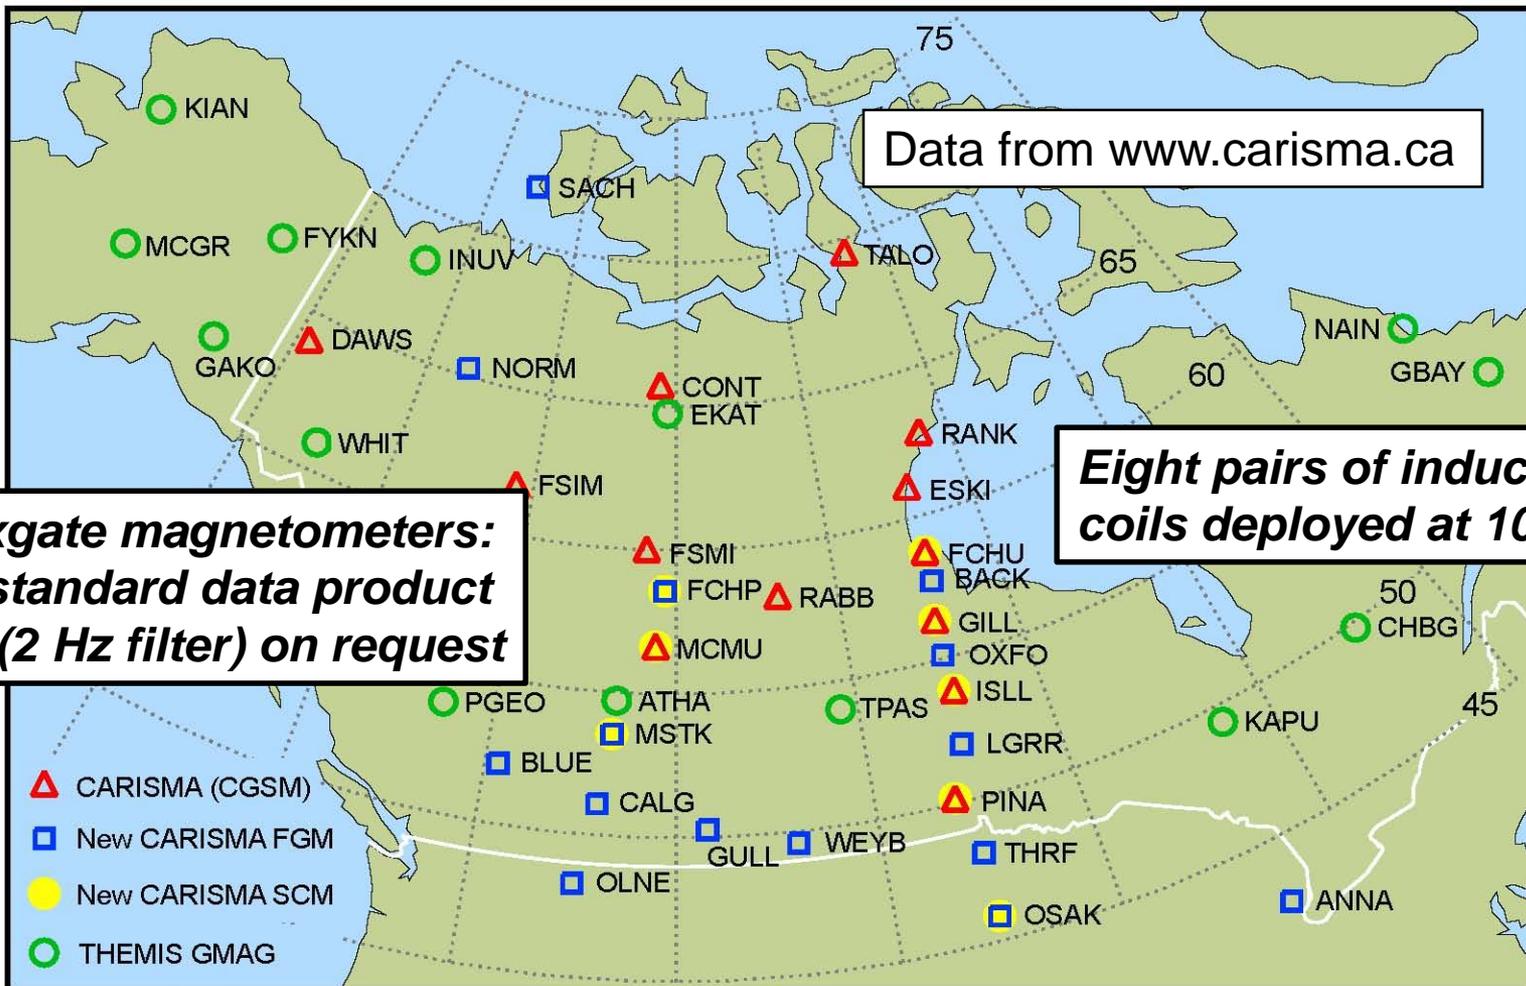

$$D_{LL}^E = \frac{1}{8B_0^2 R_E^2} \cdot L^6 \cdot \sum_m P_m^E(L, m\omega_D)$$

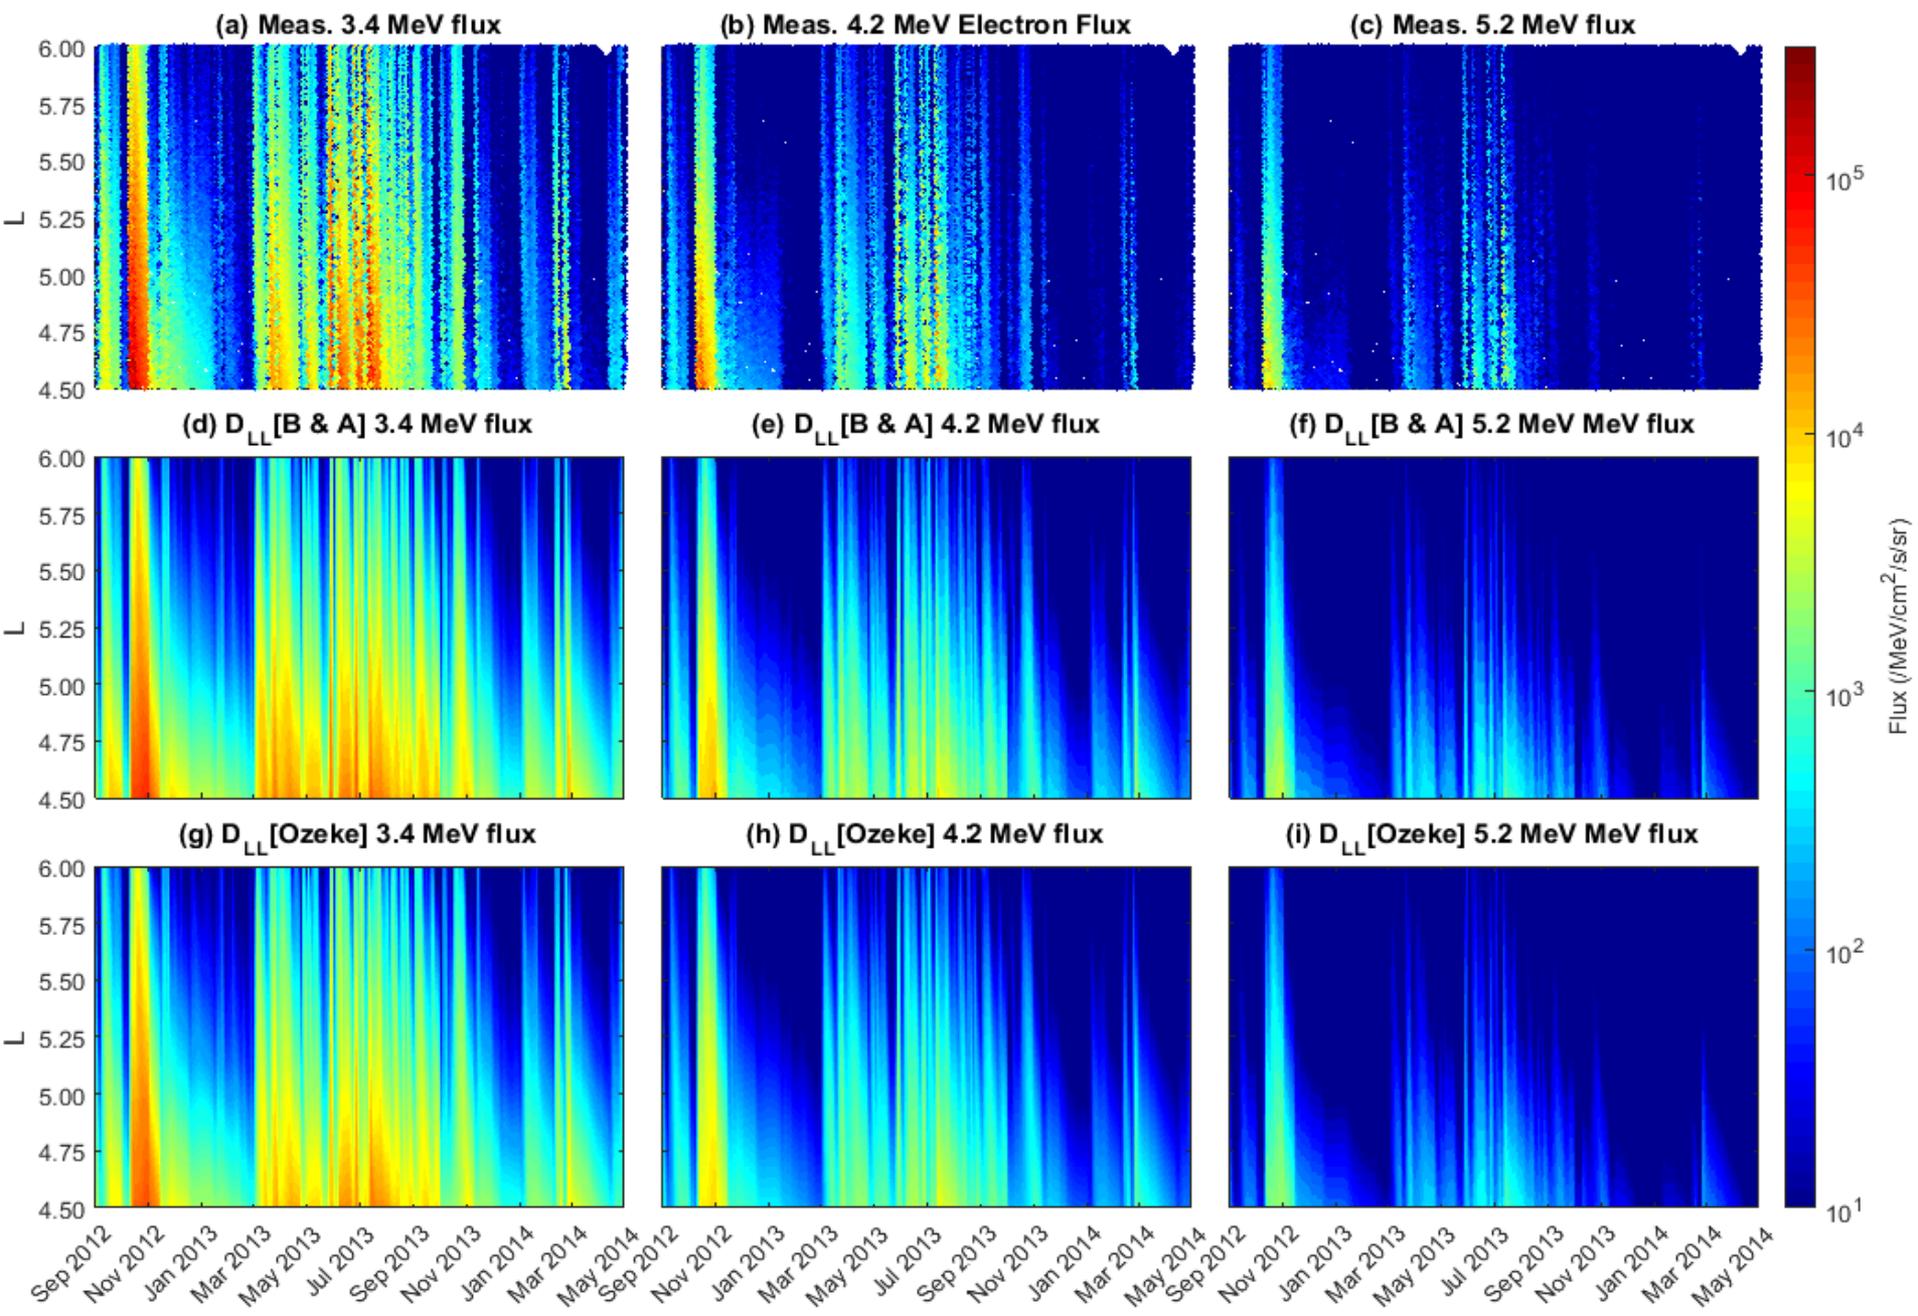

Azimuthal Electric Field
Power

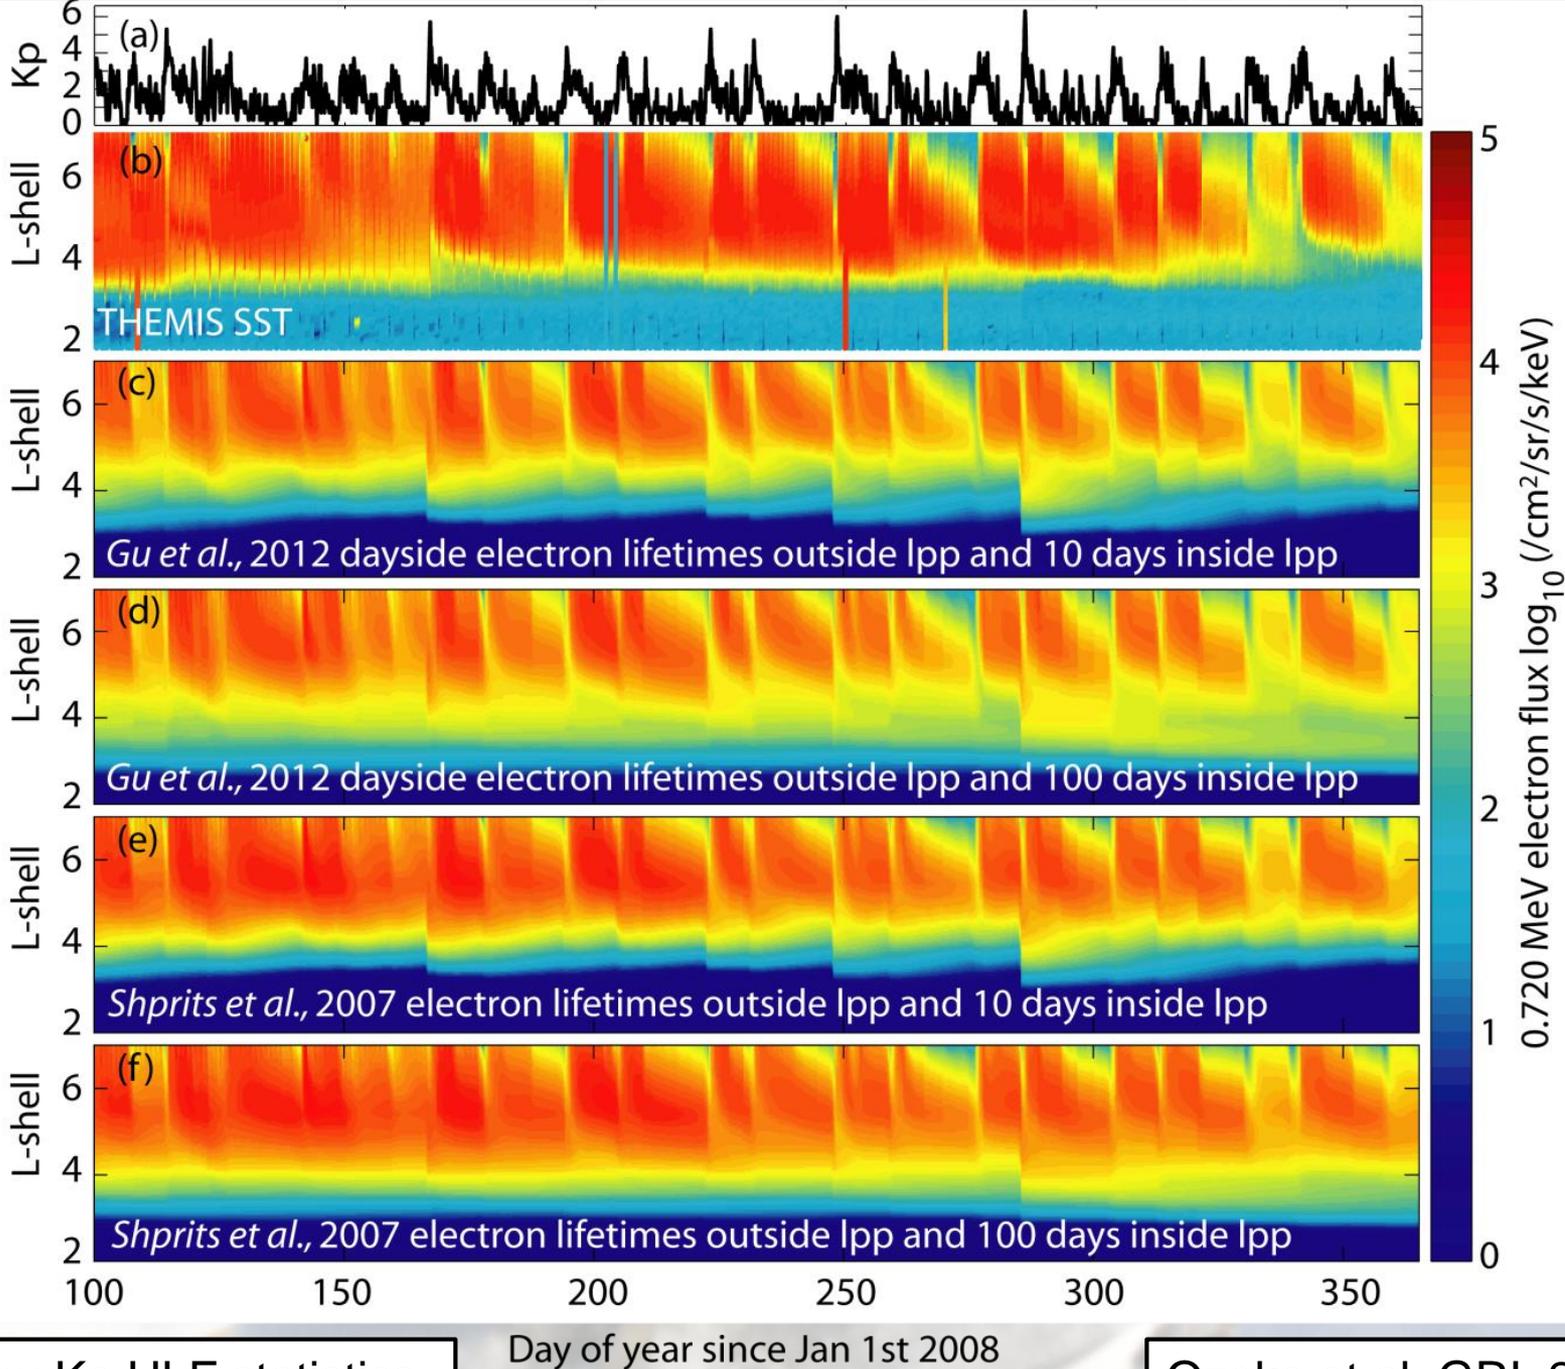

Energy dependence

*These two terms can be derived in space empirically.
Electric often dominates – allows DLL characterization from ground.*

Expanded CARISMA Magnetometer Array

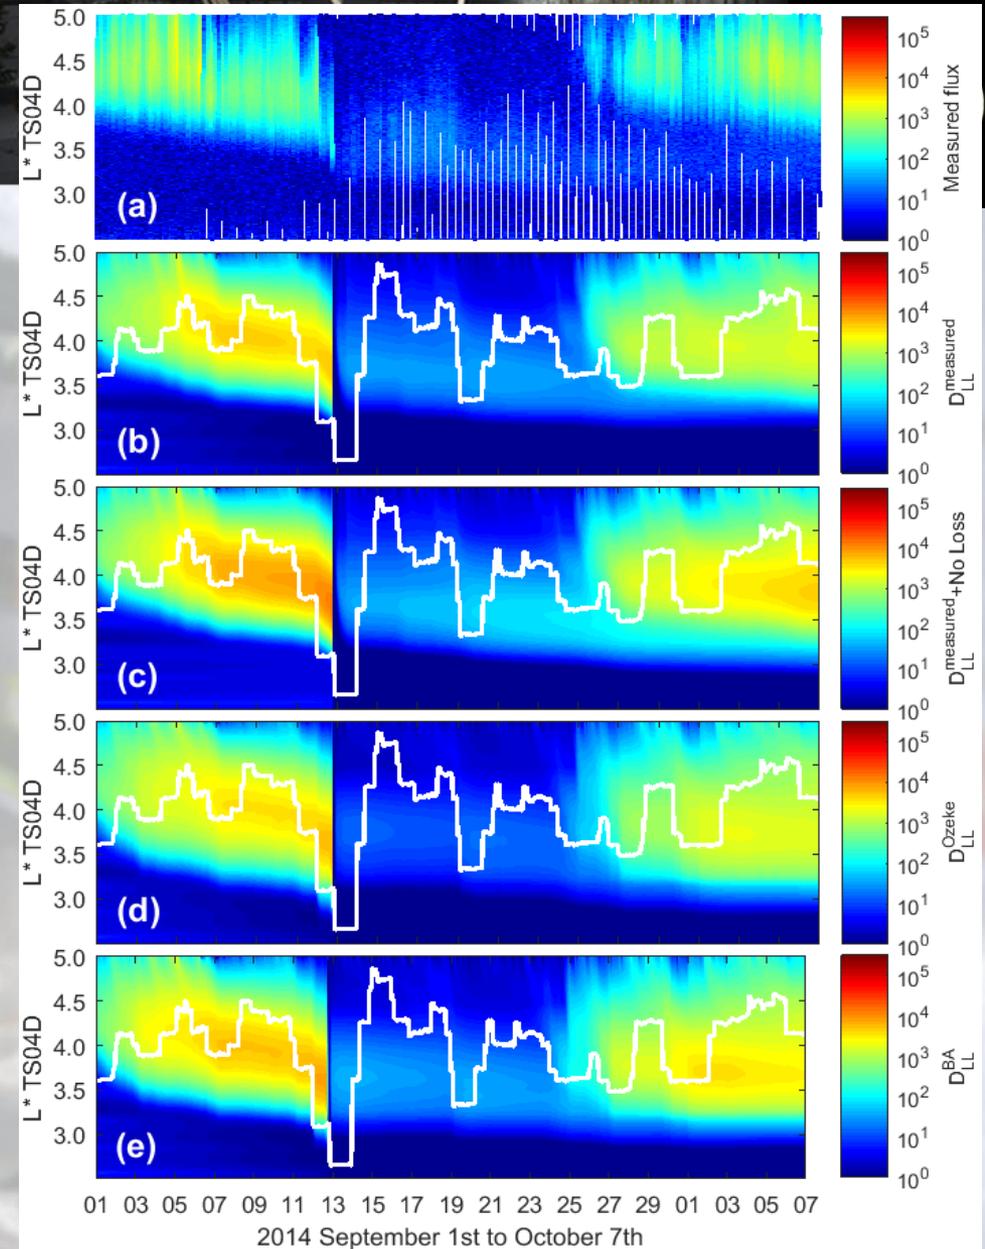

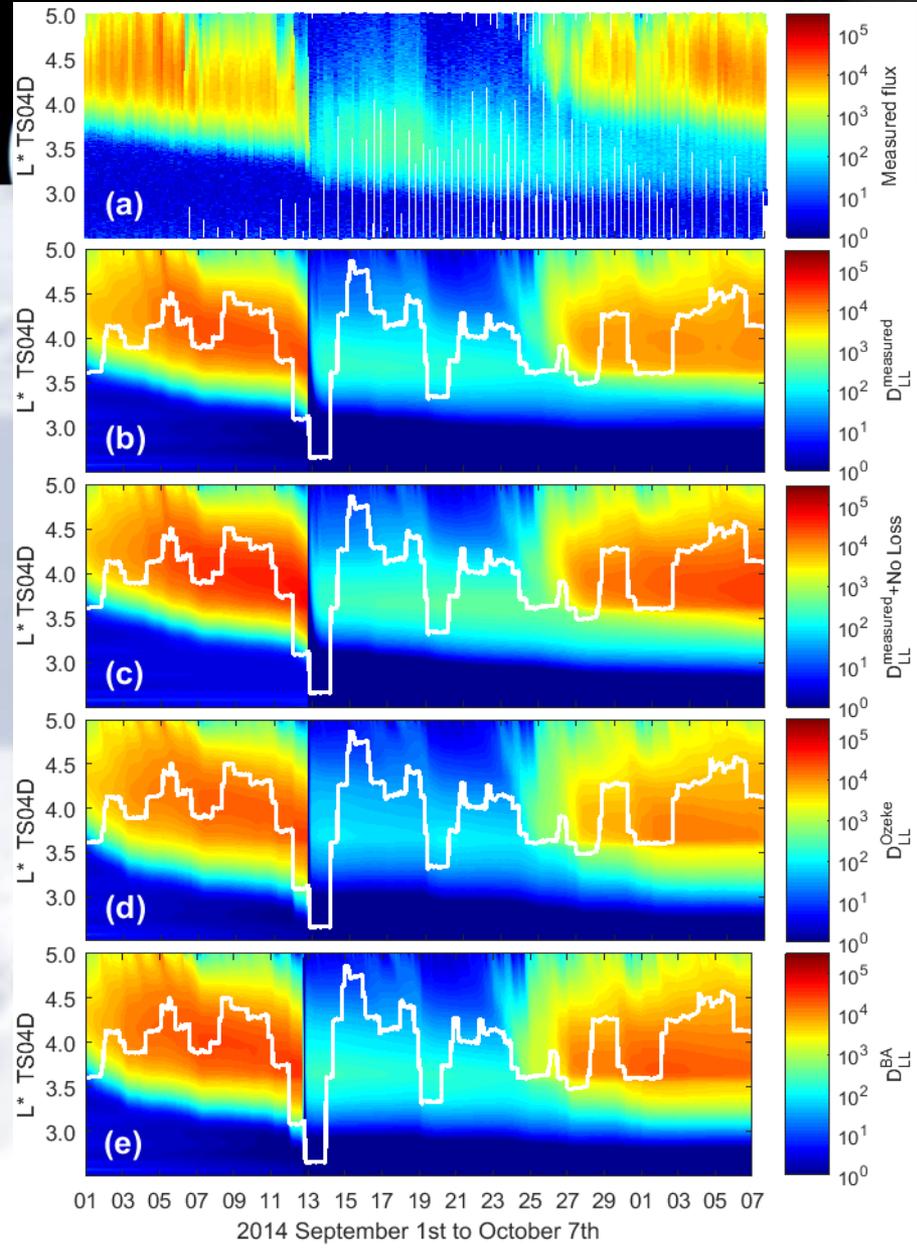

Driven by Kp ULF statistics.

Radiation Belt Extinction

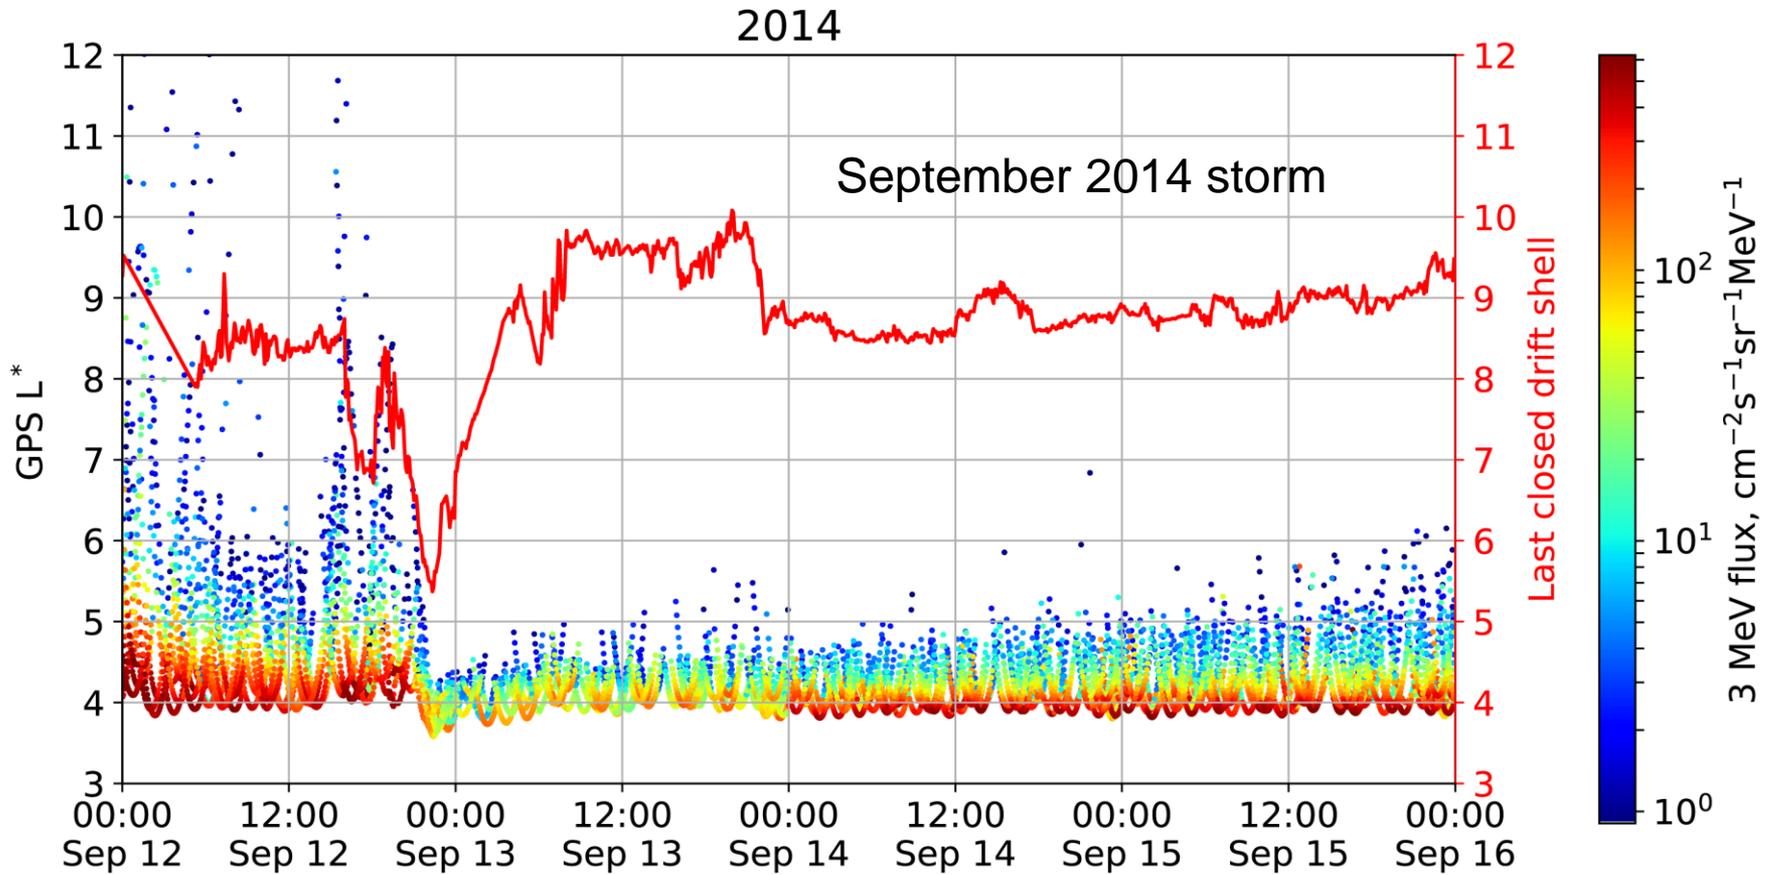

Hour timescale GPS loss; follows LCDS morphology!

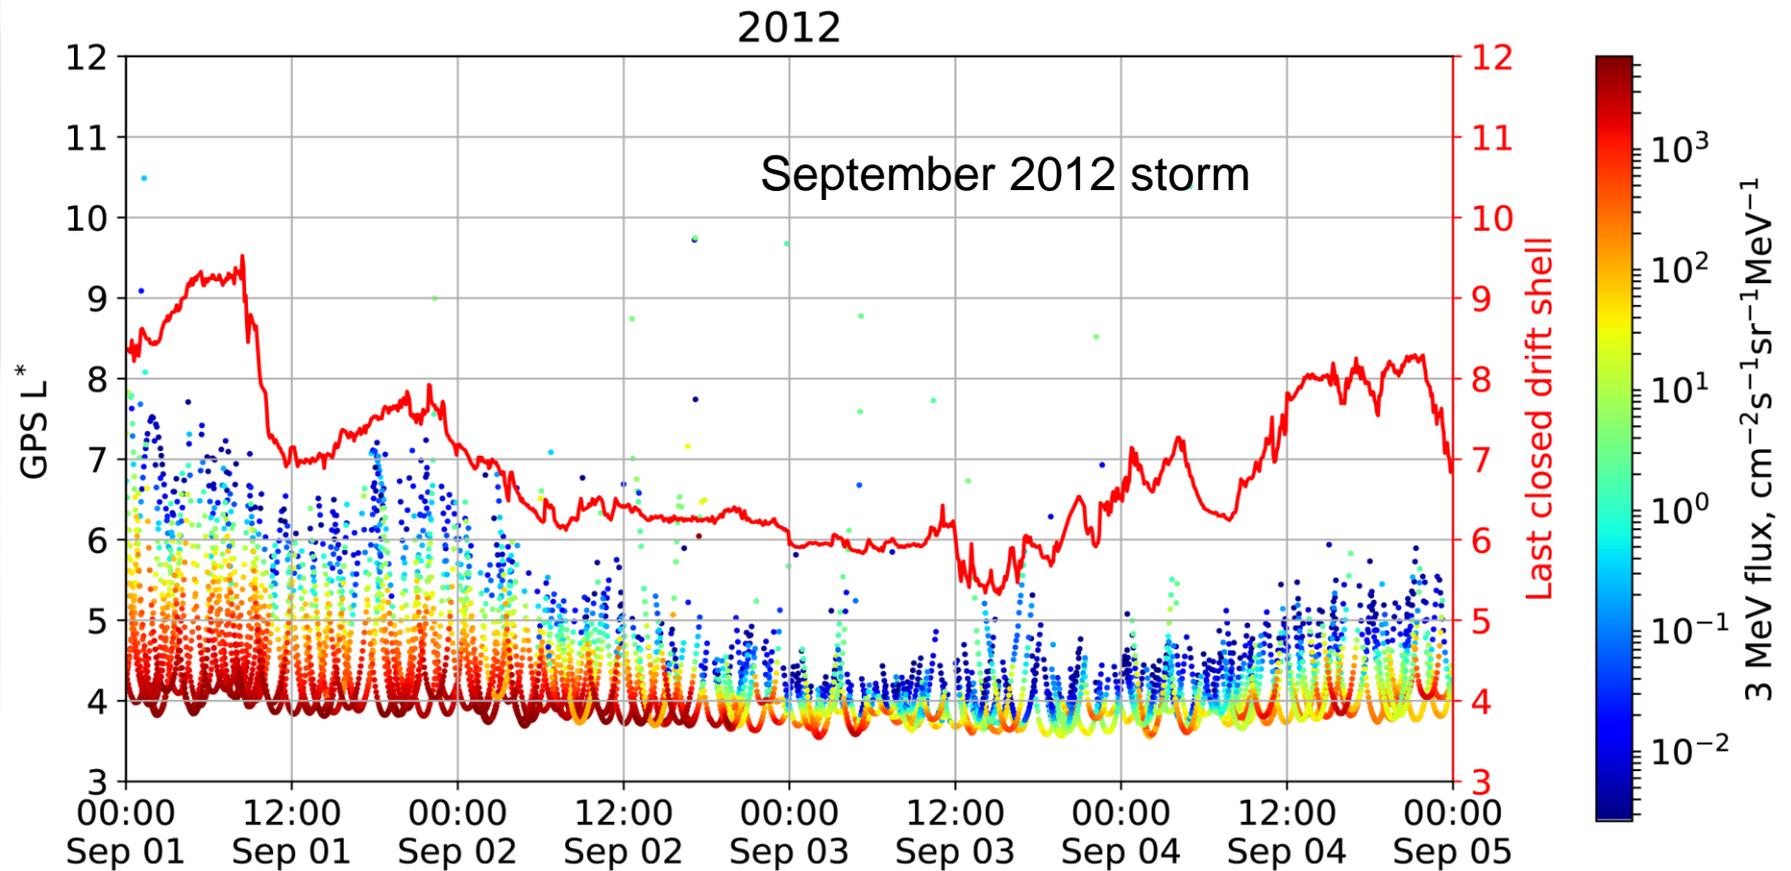

Radiation Belt Extinction

Radiation Belt Extinction

Third Radiation Belt

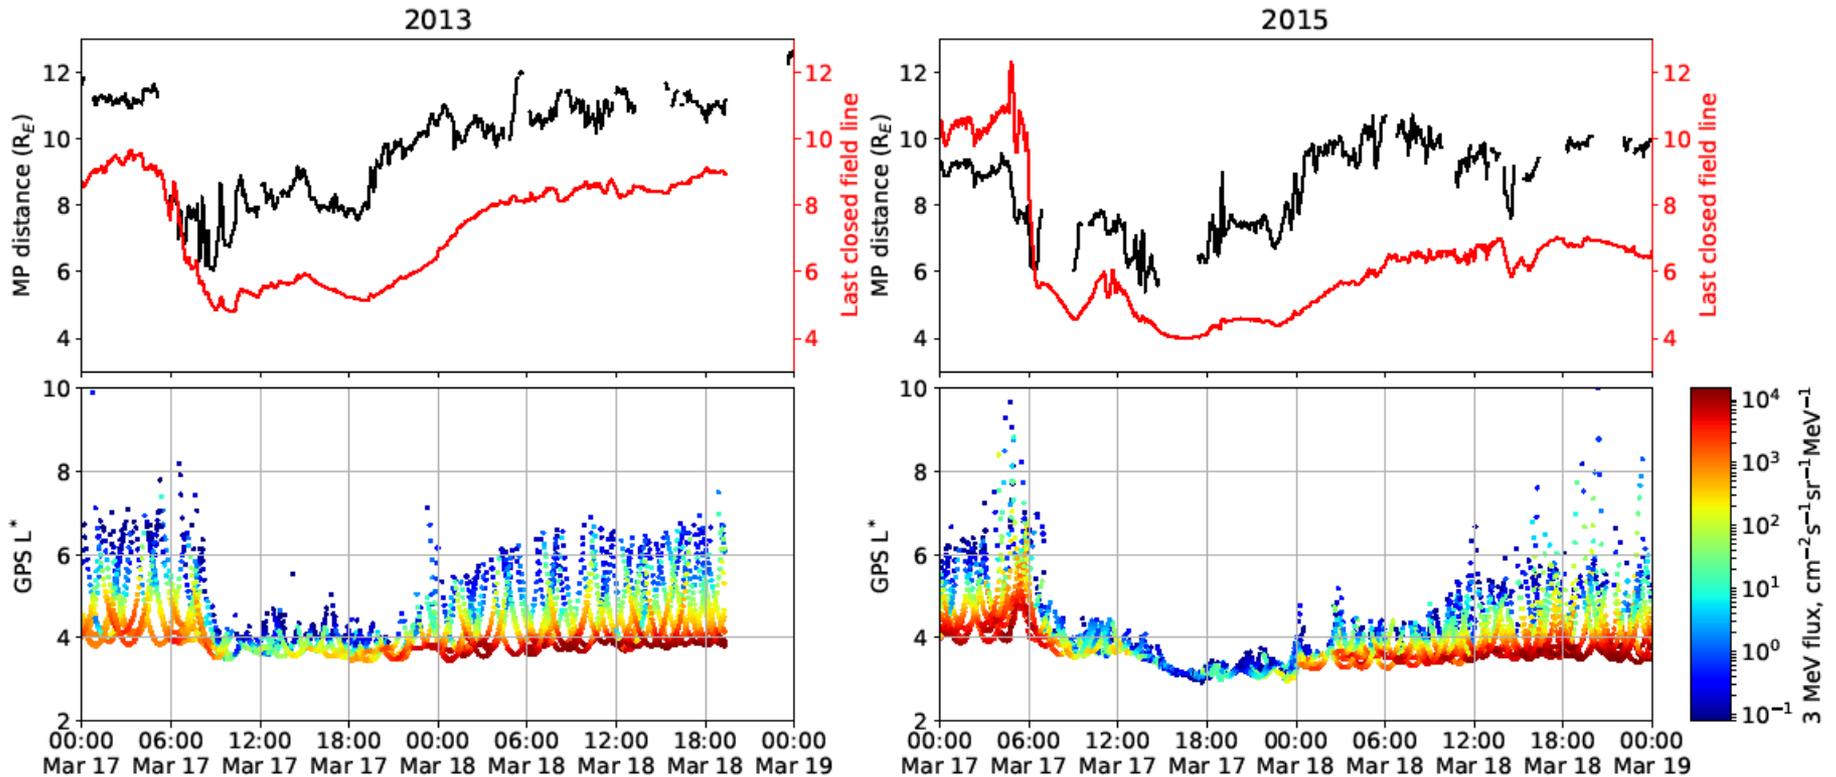

Summary and Conclusions

- ULF wave radial diffusion coupled to dynamic outer boundary condition can reproduce a wide range of observed outer belt morphologies.
- Van Allen Probes can only specify the model outer BC at best on timescales every ~4 hours. At times this may not be sufficient to capture the appropriate internal and indeed BC dynamics.
- GPS can allow the outer boundary source flux to be specified at higher temporal resolution.
- Fast ULF wave coupling, combined with still not fully unexplained fast radiation belt “extinction”, can reproduce ultra-relativistic belt dynamics!
- Has the promise to deliver simple but high fidelity ultra-relativistic radiation belt specification and forecasting!

Back Up

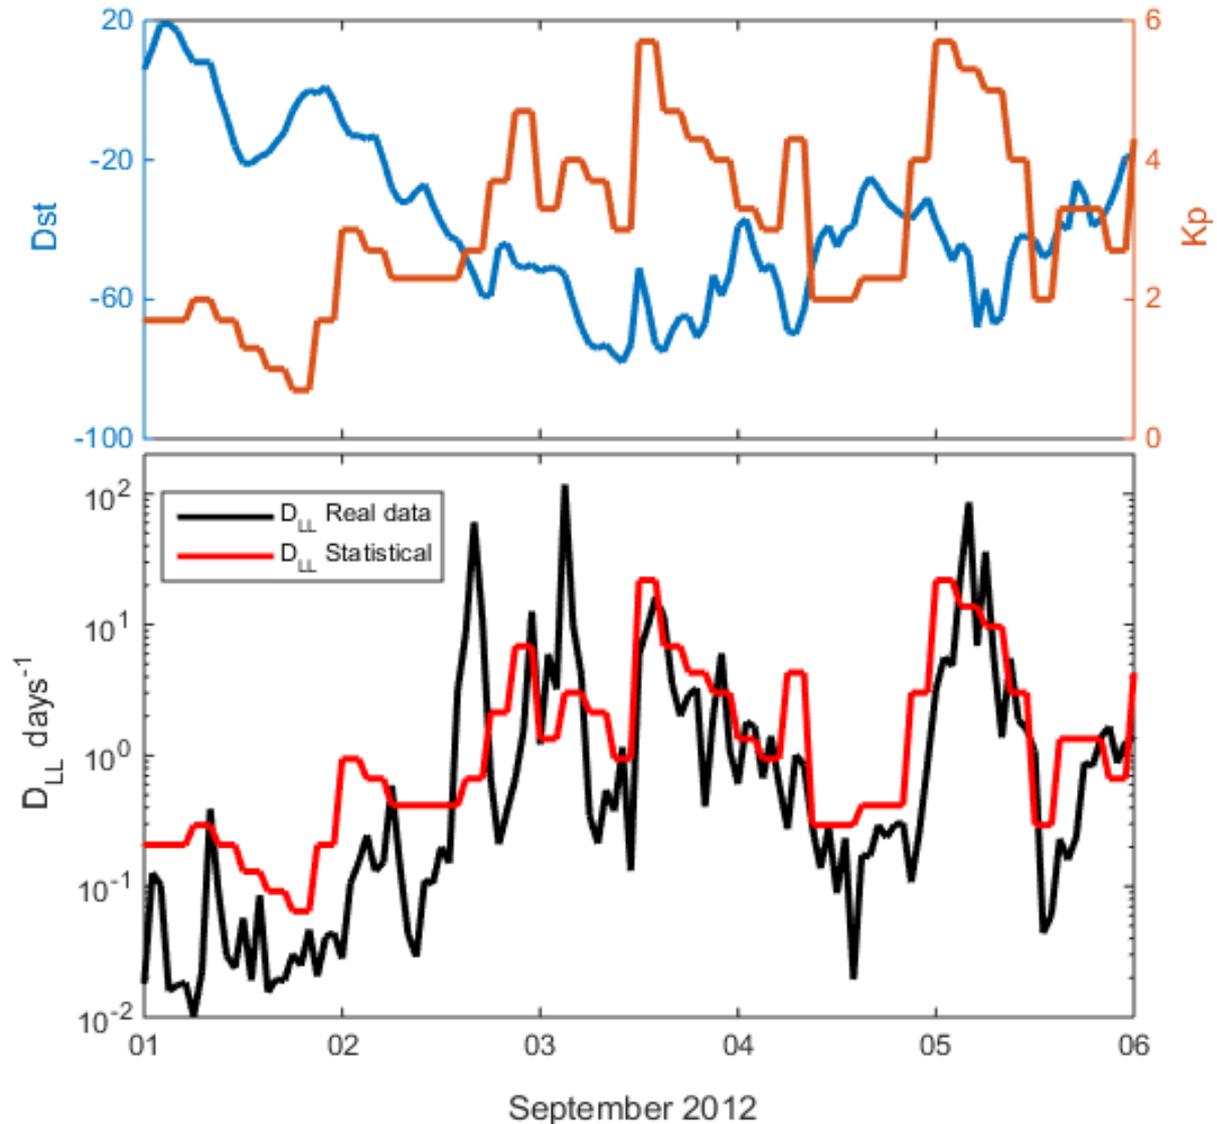

Radiation Belt Extinction

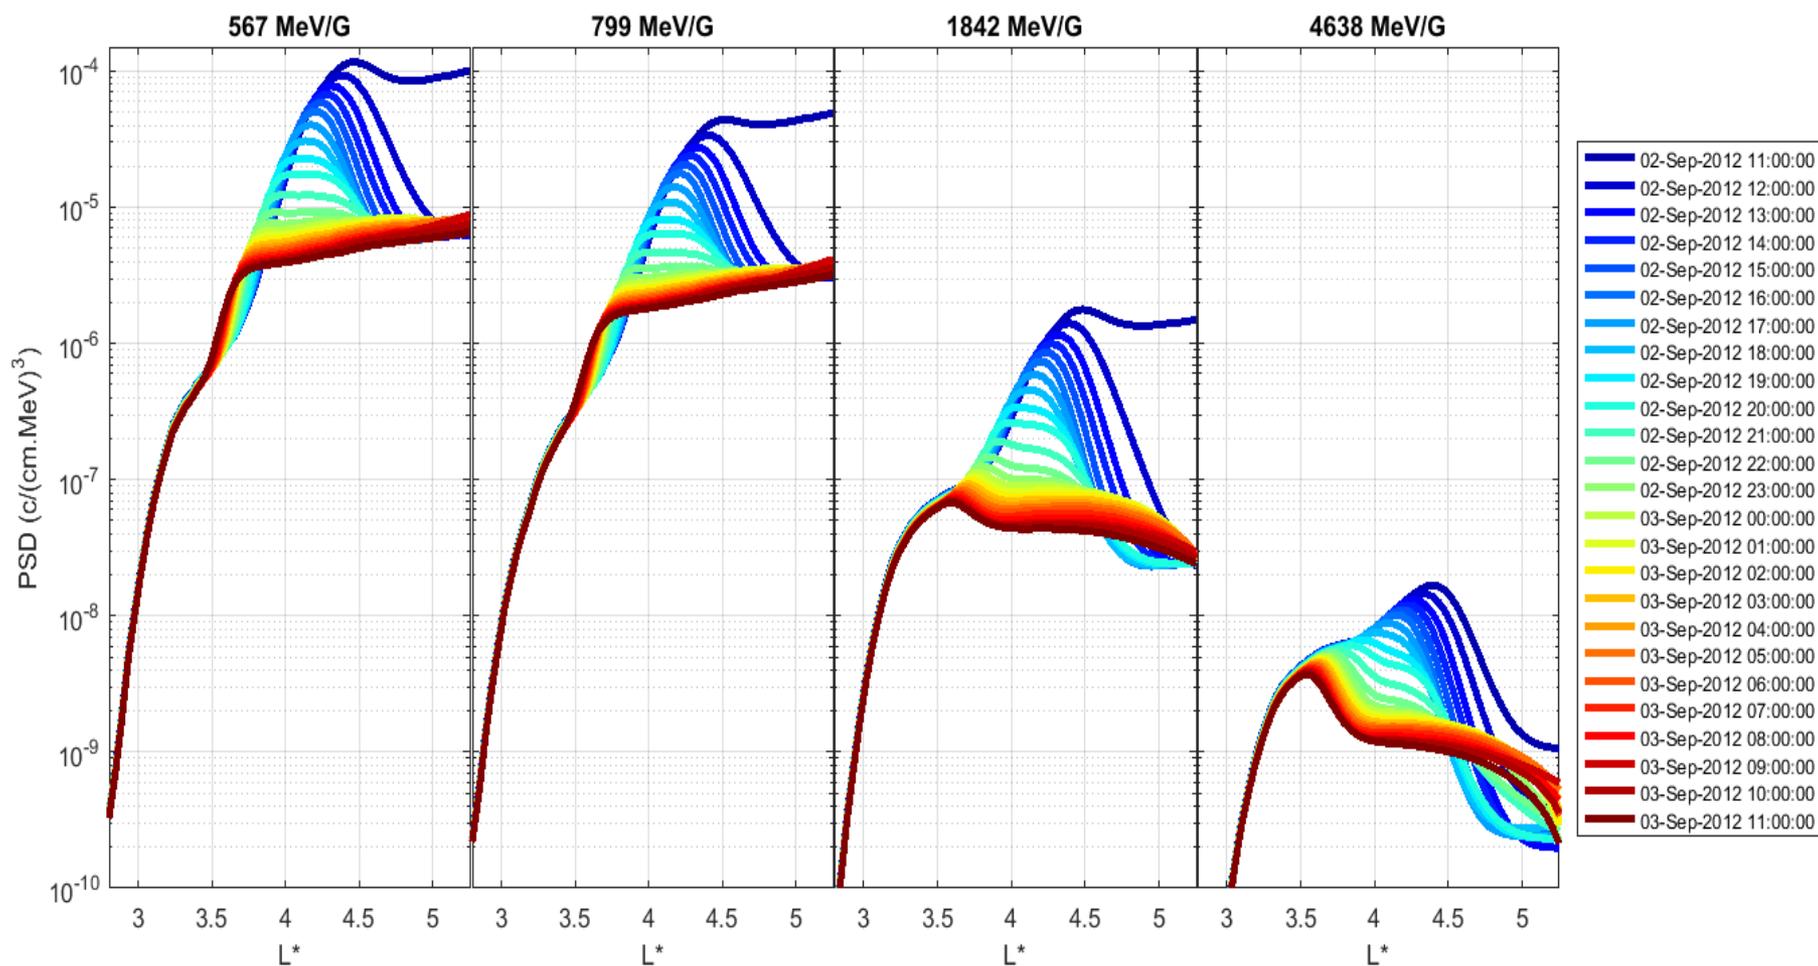

Hour timescale GPS loss; follows LCDS morphology!

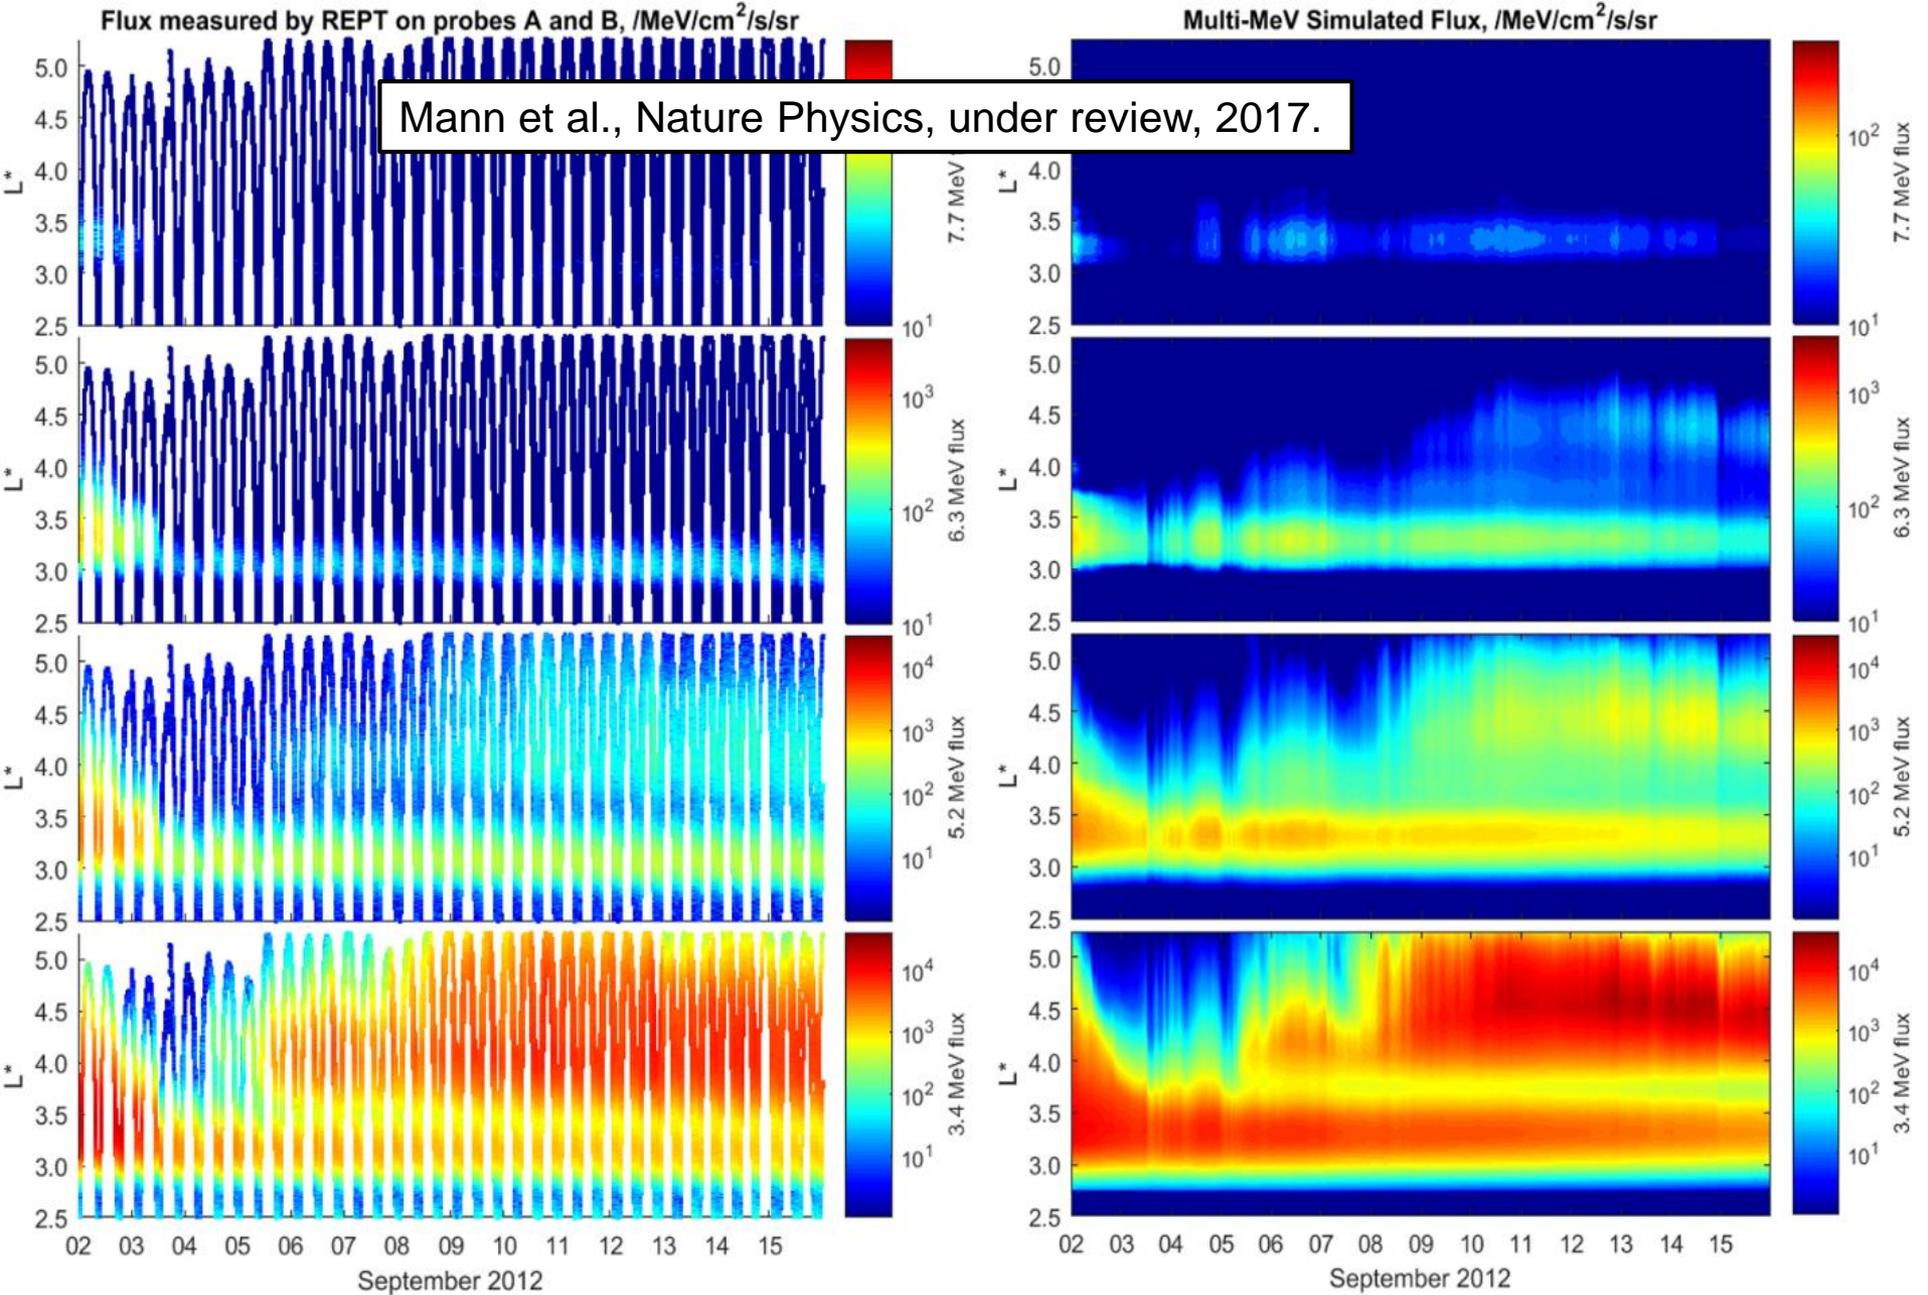

Measured vs Statistical DLL values

- Statistical DLL model follows K_p (red curves)
- DLLs derived from real data show large spikes around Sept 3rd
- Spikes not seen in the K_p model
- Models solely dependent on K_p are inadequate, especially in main phase.

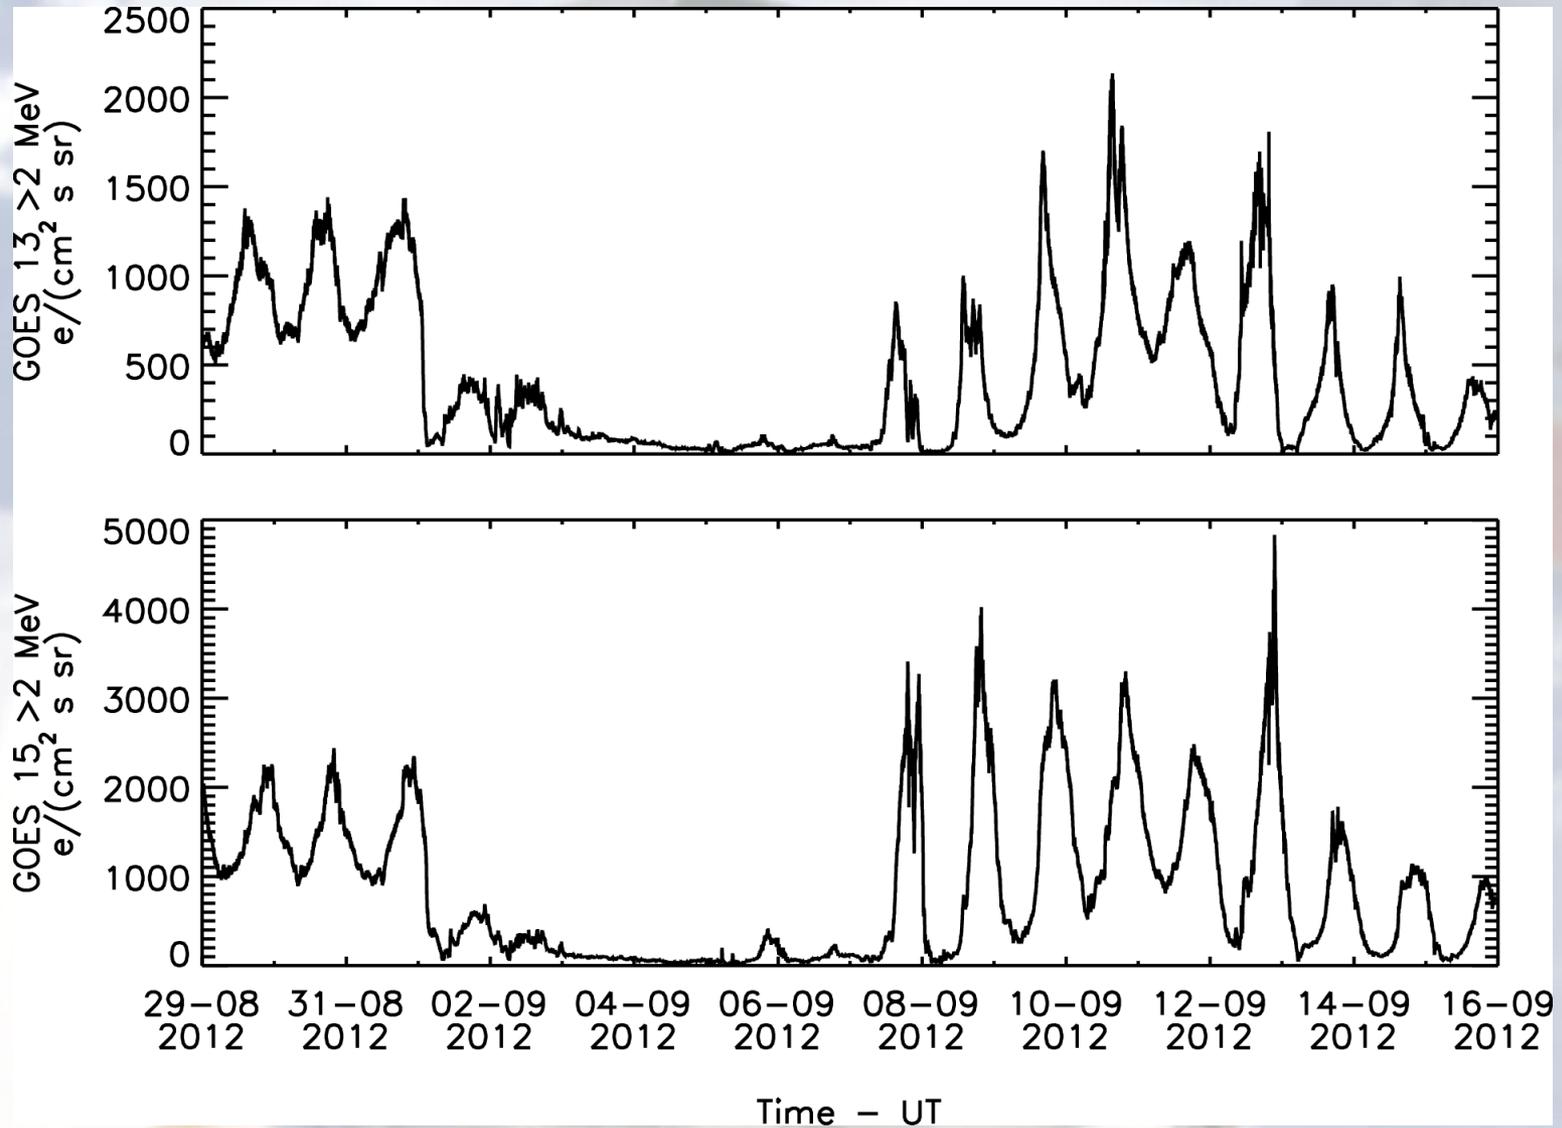

Energy-Dependent Response

ULF model reproduces observed narrow belt at higher energies > 5 MeV

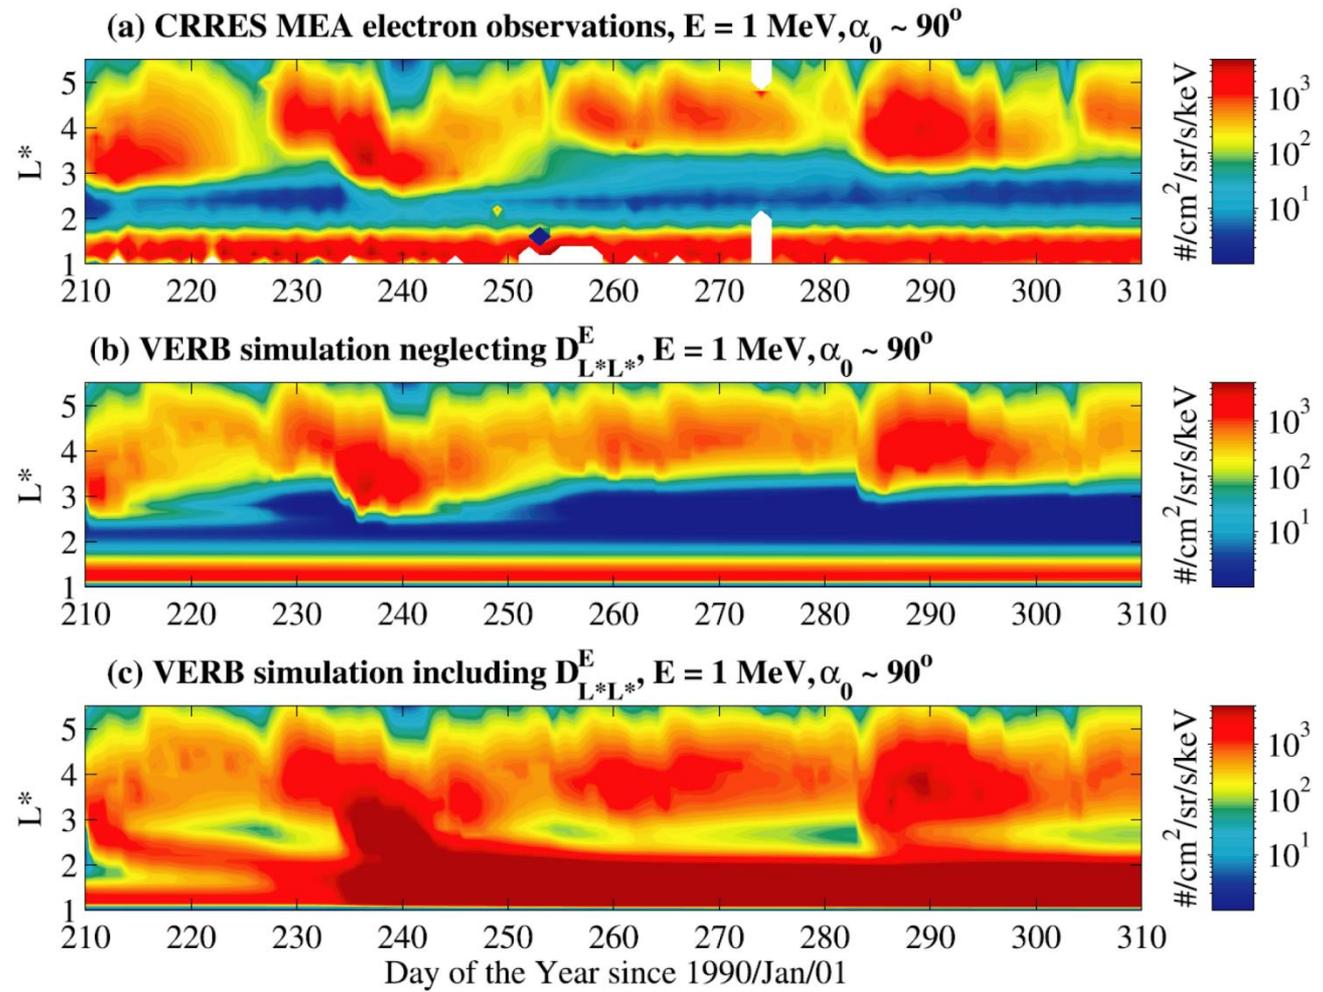

VERB model runs with Brautigam & Albert, JGR, 2000

diffusion coefficients only

EM + electrostatic ULF fluctuations

“More accurate models of radial diffusion rates should be determined in future studies and will require more accurate observations of electrostatic and electromagnetic fluctuations at
